About This Document

- This document was developed by a team at the University of Tennessee at Chattanooga led by Dr. Mengjun Xie (mengjun-xie@utc.edu).
- The development of this document was supported by a National Centers of Academic Excellence in Cybersecurity Grant (#H98230-20-1-0351), housed at the National Security Agency.
- This document is licensed with a Creative Commons Attribution 4.0 International License.

Introduction

In this lab, you will use the *Horizon Dashboard* and *OpenStack Unified CLI* to manage images, define flavors, manage private networks, launch an internal instance, and verify the instance's functionality. Images define the *software* configuration of an instance such as the operating system and installed packages, while flavors specify the *hardware* specifications such as the number of processors and the amount of memory and disk. Private networks are isolated networks within the OpenStack cloud and are not connected to external networks by default. Internal instances are connected only to private networks and are not directly accessible from external networks by default.

Objectives

- Create and manage software profiles (images).
- Create and manage hardware profiles (flavors).
- Create and manage private networks.
- Launch and verify an internal instance.

Lab Settings

The information in the table below will be needed in order to complete the lab. The task sections below provide details on the use of this information.

| Virtual Machine | IP Address | Account | Password |
|-----------------|-------------------------------------------|---------|----------|
| workstation | ens3: 192.168.1.21 ens4: 172.25.250.21 | ubuntu | ubuntu |
| devstack | ens3: 192.168.20 ens4: 172.25.250.20 | ubuntu | ubuntu |

1 Uploading Images

In this task, you will create, modify, and delete images with the *Horizon Dashboard* and *OpenStack Unified CLI*.

- 1.1. Log in to the **workstation** machine as the **ubuntu** user with password **ubuntu**.

```
Ubuntu 18.04.6 LTS workstation tty1
workstation login: ubuntu
Password:
```

- 1.2. Launch the graphical user interface.

```
ubuntu@workstation:~$ startx

Welcome to Ubuntu 18.04.6 LTS (GNU/Linux 4.15.0-213-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

 System information as of Fri Jun  7 21:01:55 UTC 2024

 System load:  0.6                  Processes:           197
 Usage of /:   7.9% of 116.12GB    Users logged in:      0
 Memory usage: 13%                IP address for ens3: 192.168.1.21
 Swap usage:   0%                 IP address for ens4: 172.25.250.21

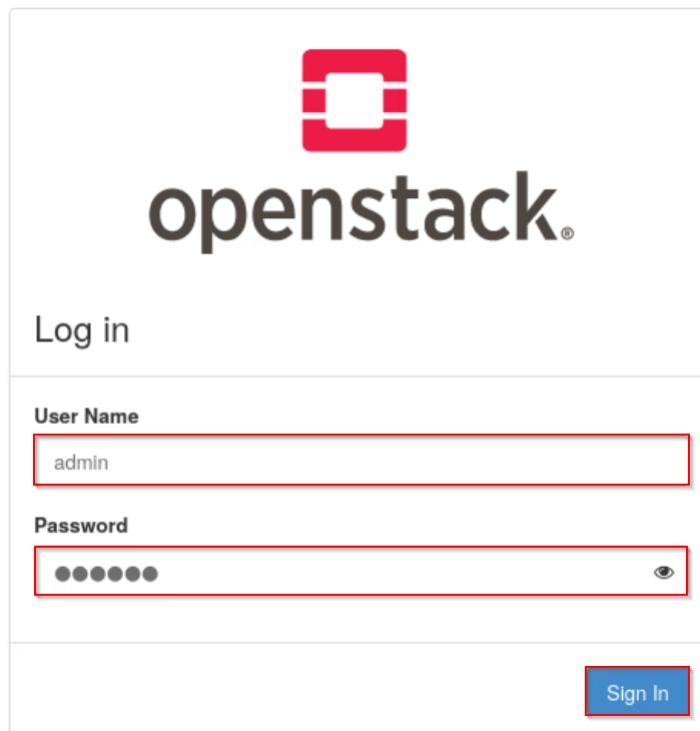

Expanded Security Maintenance for Infrastructure is not enabled.

2 updates can be applied immediately.
To see these additional updates run: apt list --upgradable

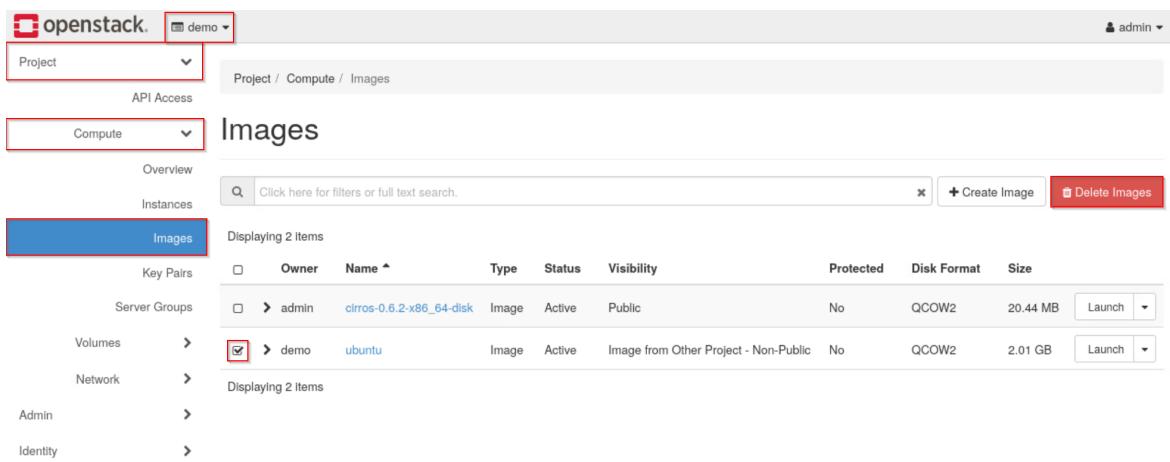

146 additional security updates can be applied with ESM Infra.
Learn more about enabling ESM Infra service for Ubuntu 18.04 at
https://ubuntu.com/18-04

ubuntu@workstation:~$ startx_
```

- 1.3.** Open the web browser, and navigate to **192.168.1.20**. Log in to the dashboard as **admin** with the password **secret**.

- 1.4.** Select the **demo** project. In this lab, we will create our own Ubuntu images, so the default one is not needed and can be deleted. Navigate to **Project > Compute > Images**. Select the **ubuntu** image and click **Delete Image**.

| | Owner | Name | Type | Status | Visibility | Protected | Disk Format | Size | |
|-------------------------------------|-------|--------------------------|-------|--------|---------------------------------------|-----------|-------------|----------|---------------------------------------|
| <input type="checkbox"/> | admin | cirros-0.6.2-x86_64-disk | Image | Active | Public | No | QCOW2 | 20.44 MB | <input type="button" value="Launch"/> |
| <input checked="" type="checkbox"/> | demo | ubuntu | Image | Active | Image from Other Project - Non-Public | No | QCOW2 | 2.01 GB | <input type="button" value="Launch"/> |

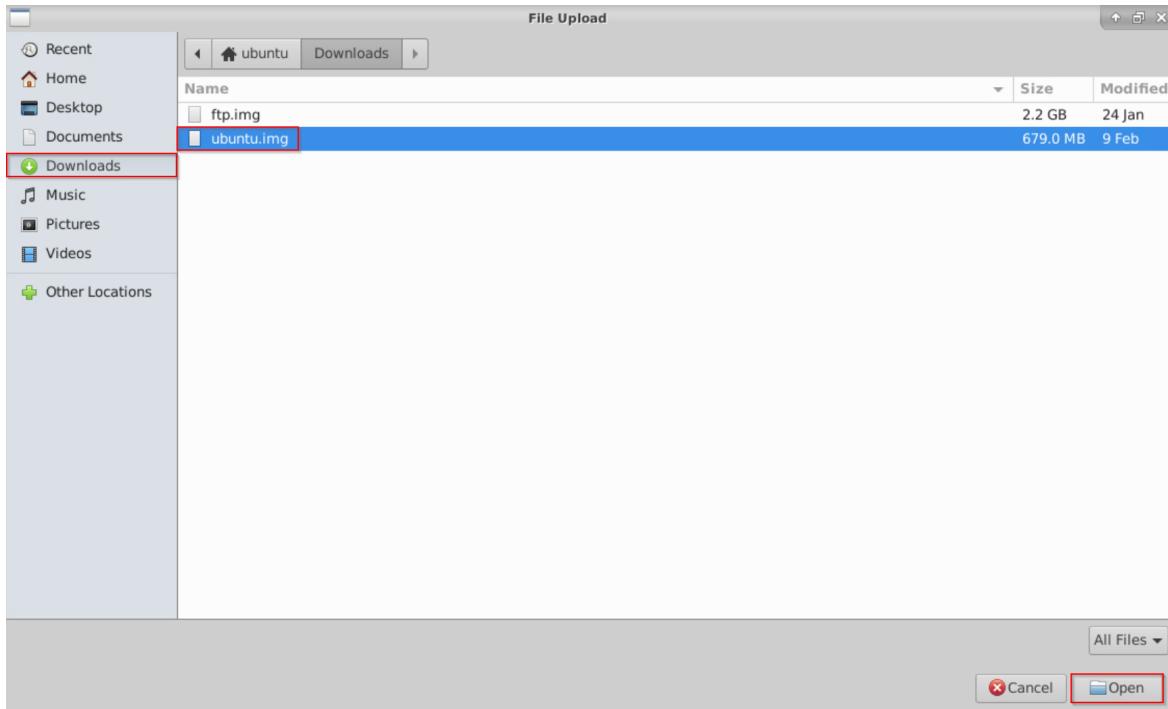

- 1.5.** Click **Create Image** to create a new image through an image file upload. As you will see in the next steps, premade image files are provided in the lab environment.

The screenshot shows the OpenStack Compute Images interface. The left sidebar has sections for Project, API Access, Compute (with sub-options Overview, Instances, and Images selected), Key Pairs, Server Groups, Volumes, Network, Admin, and Identity. The main area displays a table of images, with one item listed: cirros-0.6.2-x86_64-disk. The table columns are Owner, Name, Type, Status, Visibility, Protected, Disk Format, and Size. A search bar at the top allows filtering or full text search. At the bottom right of the table, there are 'Create Image' and 'Delete Images' buttons, with 'Create Image' being highlighted by a red box.

- 1.6.** Enter **ubuntu1** into the *Image Name* field. Under **File**, click **Browse...**

The screenshot shows the 'Create Image' dialog. The 'Image Details' tab is selected. The 'Image Name' field contains 'ubuntu1'. Below it, the 'Image Source' section shows a 'File' input field with a 'Browse...' button, which is also highlighted by a red box. To the right of the 'File' field is an 'Image Description' input field. A 'Metadata' link is visible on the left side of the dialog.

- 1.7.** In the file browser, navigate to **Downloads**, then select the **ubuntu.img** file. Click **Open**.

- 1.8.** In the *Format* dropdown, select **QCOW2 - QEMU Emulator**, and under *Image Sharing*, set *Visibility* to **Private**. Click **Create Image**.

Format*
QCOW2 - QEMU Emulator

Image Requirements

| | |
|-----------------|-----------------|
| Kernel | Ramdisk |
| Choose an image | Choose an image |

| | | |
|--------------|-------------------|------------------|
| Architecture | Minimum Disk (GB) | Minimum RAM (MB) |
| | 0 | 0 |

Image Sharing

| | |
|------------|-----------|
| Visibility | Protected |
| Private | Yes No |

< Back Next > **Create Image**

Stop

Wait for the **ubuntu1** status to be *Active*. You may need to refresh the browser until you see the status of *Active*.

- 1.9.** To edit the image after it has been created, open the dropdown menu next to the **Launch** button in the row of **ubuntu1**, and click **Edit Image**.

The screenshot shows the OpenStack Compute Images interface. In the 'Images' section, there is a table displaying two items: 'cirros-0.6.2-x86_64-disk' and 'ubuntu1'. The 'ubuntu1' row has a 'Launch' button with a dropdown menu. The 'Edit Image' option in this menu is highlighted with a red box.

| | Owner | Name | Type | Status | Visibility | Protected | Disk Format | Size |
|-------|--------------------------|-------|--------|---------|------------|-----------|-------------|--------|
| admin | cirros-0.6.2-x86_64-disk | Image | Active | Public | No | QCOW2 | 20.44 MB | Launch |
| demo | ubuntu1 | Image | Active | Private | No | QCOW2 | 647.50 MB | Launch |

- 1.10.** Enter **10** in the *Minimum Disk (GB)* field, and select **Yes** for *Protected*. Click **Update Image**. Adding a minimum disk amount will require any new instance created with this image to allocate at least 10 GB of disk space. When an image or other OpenStack resource is protected, it cannot be deleted without first making it unprotected again.

The screenshot shows the 'Edit Image' dialog box. The 'Image Details' tab is selected. The 'Image Name' field contains 'ubuntu1'. The 'Format' dropdown is set to 'QCOW2 - QEMU Emulator'. In the 'Image Requirements' section, the 'Minimum Disk (GB)' field is set to '10'. Under 'Protected', the 'Yes' radio button is selected. At the bottom right, the 'Update Image' button is highlighted with a red box.

- 1.11.** Reopen the dropdown next to the **Launch** button in the same row as **ubuntu1**. Notice that the option to delete the image no longer appears because the image is protected.

| ID | Owner | Name | Type | Status | Visibility | Protected | Disk Format | Size |
|--------------------------------------|-------|--------------------------|-------|--------|------------|-----------|-------------|-----------|
| dfc5286d-bdb7-4338-8e4b-087422b21e68 | admin | cirros-0.6.2-x86_64-disk | Image | Active | Public | No | QCOW2 | 20.44 MB |
| fd765042-c3e4-49a3-b1dc-9a81e02197c9 | demo | ubuntu1 | Image | Active | Private | Yes | QCOW2 | 647.50 MB |

- 1.12.** Log out of the *Horizon Dashboard* and close the web browser.

- 1.13.** Open a terminal if one is not already open, and source the **keystonerc-admin** file to load the **admin** user credentials.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source keystonerc-admin
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.14.** List the current OpenStack images.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image list
+-----+-----+-----+
| ID   | Name  | Status |
+-----+-----+-----+
| dfc5286d-bdb7-4338-8e4b-087422b21e68 | cirros-0.6.2-x86_64-disk | active |
| fd765042-c3e4-49a3-b1dc-9a81e02197c9 | ubuntu1                  | active |
+-----+-----+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.15.** Try to delete the **ubuntu1** image while it is protected. The command should return an HTTP 403 (Forbidden) error.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image delete ubuntu1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image delete ubuntu1
Failed to delete image with name or ID 'ubuntu1': 403 Forbidden: Image fd765042-
c3e4-49a3-b1dc-9a81e02197c9 is protected and cannot be deleted. (HTTP 403)
Failed to delete 1 of 1 images.
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.16.** Set the **ubuntu1** image to unprotected so that it can be deleted.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image set \
> --unprotected ubuntu1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image set \
> --unprotected ubuntu1
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.17.** Delete the **ubuntu1** image.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image delete ubuntu1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image delete ubuntu1
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.18.** List the images again to confirm that the image was deleted.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image list
+-----+-----+-----+
| ID      | Name          | Status |
+-----+-----+-----+
| dfc5286d-bdb7-4338-8e4b-087422b21e68 | cirros-0.6.2-x86_64-disk | active |
+-----+-----+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 1.19.** Now, we will recreate and modify the image from the command line. Create the **ubuntu2** image with the **~/Downloads/ubuntu.img** file and the QCOW2 format.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image create \
> --disk-format qcow2 \
> --file ~/Downloads/ubuntu.img \
> ubuntu2
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack image create \
> --disk-format qcow2 \
> --file ~/Downloads/ubuntu.img \
> ubuntu2

- 1.24.** Leave the terminal window open and continue to the next task.

2 Defining Flavors

In this task, you will create and delete flavors with the *Horizon Dashboard* and *OpenStack Unified CLI*.

- 2.1. Open the web browser, and navigate to **192.168.1.20**. Log in to the dashboard as the **admin** user with the password **secret**.
- 2.2. Select **demo** project. We will not need any of the existing flavors in this lab, so any of them can be safely deleted. For demonstration, navigate to **Admin > Compute > Flavors**, select the **ds1G** flavor, and click **Delete Flavors**.

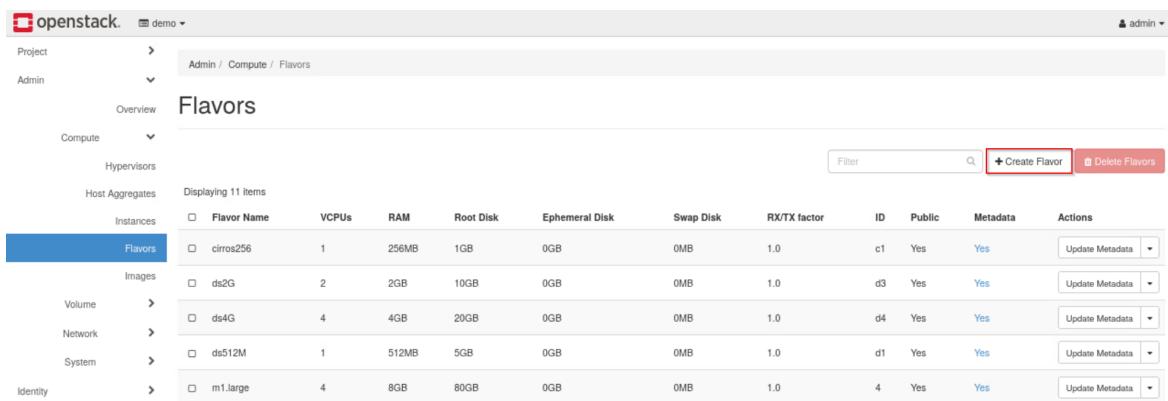

| Flavor Name | VCPUs | RAM | Root Disk | Ephemeral Disk | Swap Disk | RX/TX factor | ID | Public | Metadata | Actions |
|-------------|----------|------------|-------------|----------------|------------|--------------|-----------|------------|------------|----------------------------------|
| cirros256 | 1 | 256MB | 1GB | 0GB | 0MB | 1.0 | c1 | Yes | Yes | <button>Update Metadata</button> |
| ds1G | 1 | 1GB | 10GB | 0GB | 0MB | 1.0 | d2 | Yes | Yes | <button>Update Metadata</button> |
| ds2G | 2 | 2GB | 10GB | 0GB | 0MB | 1.0 | d3 | Yes | Yes | <button>Update Metadata</button> |
| ds4G | 4 | 4GB | 20GB | 0GB | 0MB | 1.0 | d4 | Yes | Yes | <button>Update Metadata</button> |
| ds512M | 1 | 512MB | 5GB | 0GB | 0MB | 1.0 | d1 | Yes | Yes | <button>Update Metadata</button> |

Tip

Alternatively, to delete a flavor, you can open the dropdown next to the **Update Metadata** button in the same row as the flavor, then click **Delete Flavor**.

- 2.3. Now, we will create our own flavor. On the same page, click **Create Flavor**.

| Flavor Name | VCPUs | RAM | Root Disk | Ephemeral Disk | Swap Disk | RX/TX factor | ID | Public | Metadata | Actions |
|-----------------|----------|--------------|-------------|----------------|------------|--------------|-----------|------------|------------|----------------------------------|
| cirros256 | 1 | 256MB | 1GB | 0GB | 0MB | 1.0 | c1 | Yes | Yes | <button>Update Metadata</button> |
| ds2G | 2 | 2GB | 10GB | 0GB | 0MB | 1.0 | d3 | Yes | Yes | <button>Update Metadata</button> |
| ds4G | 4 | 4GB | 20GB | 0GB | 0MB | 1.0 | d4 | Yes | Yes | <button>Update Metadata</button> |
| ds512M | 1 | 512MB | 5GB | 0GB | 0MB | 1.0 | d1 | Yes | Yes | <button>Update Metadata</button> |
| m1.large | 4 | 8GB | 80GB | 0GB | 0MB | 1.0 | 4 | Yes | Yes | <button>Update Metadata</button> |

- 2.4. Enter **flavor1** in the *Name* field, **2** in the *VCPUs* field, **1024** in the *RAM (MB)* field, and **10** in the *Root Disk (GB)* field. Click **Create Flavor**.

Create Flavor

Flavor Information * Flavor Access

Name *
flavor1

ID ?
auto

VCPUs *
2

RAM (MB) *
1024

Root Disk (GB) *
10

Ephemeral Disk (GB)
0

Swap Disk (MB)
0

RX/TX Factor
1

Flavors define the sizes for RAM, disk, number of cores, and other resources and can be selected when users deploy instances.

Cancel Create Flavor

Note

At the time of writing, there is no way to update flavors (apart from their metadata) from the Horizon Dashboard after a flavor has been created. Any changes will require deleting the flavor and remaking it.

- 2.5. Log out of the *Horizon Dashboard* and close the web browser.

- 2.6.** Now, we will create a similar flavor from the command line. If a terminal is not already open, open one and source the `~/keystonerc-admin` file.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 2.7.** List the current OpenStack flavors.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor list
```

| ID | Name | RAM | Disk | Ephemeral | VCPUs | Is Public |
|--------------------------------------|-----------|-------|------|-----------|-------|-----------|
| 1 | m1.tiny | 512 | 1 | 0 | 1 | True |
| 2 | m1.small | 2048 | 20 | 0 | 1 | True |
| 3 | m1.medium | 4096 | 40 | 0 | 2 | True |
| 36e8dc04-8957-48cd-8434-f6da50080173 | flavor1 | 1024 | 10 | 0 | 2 | True |
| 4 | m1.large | 8192 | 80 | 0 | 4 | True |
| 42 | m1.nano | 128 | 1 | 0 | 1 | True |
| 5 | m1.xlarge | 16384 | 160 | 0 | 8 | True |
| 84 | m1.micro | 192 | 1 | 0 | 1 | True |
| c1 | cirros256 | 256 | 1 | 0 | 1 | True |
| d1 | ds512M | 512 | 5 | 0 | 1 | True |
| d3 | ds2G | 2048 | 10 | 0 | 2 | True |
| d4 | ds4G | 4096 | 20 | 0 | 4 | True |

- 2.8.** Create a flavor named **flavor2** with **1 VCPU**, **1024 MB** of RAM, a **10 GB** root disk, a **2 GB** ephemeral disk, and a **1024 MB** swap disk.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor create \
> --vcpus 1 \
> --ram 1024 \
> --disk 10 \
> --ephemeral 2 \
> --swap 1024 \
> flavor2
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor create \
> --vcpus 1 \
> --ram 1024 \
> --disk 10 \
> --ephemeral 2 \
> --swap 1024 \
> flavor2
+-----+
| Field          | Value
+-----+
| OS-FLV-DISABLED:disabled | False
| OS-FLV-EXT-DATA:ephemeral | 2
| disk            | 10
| id              | 12c985b6-5506-4656-808b-cde996342518
| name            | flavor2
| os-flavor-access:is_public | True
| properties      |
| ram             | 1024
| rxtx_factor    | 1.0
| swap            | 1024
| vcpus           | 1
+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

Note

Ephemeral storage is disk space that persists only until the instance is terminated. Swap space allows the operating system to use a portion of hard disk space as additional RAM if the physical memory becomes full.

- 2.9. Verify that the **flavor2** flavor has been created and has the correct values by listing the flavors.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor list
```

| ID | Name | RAM | Disk | Ephemeral | VCPUs | Is Public |
|--------------------------------------|-----------|-------|------|-----------|-------|-----------|
| 1 | m1.tiny | 512 | 1 | 0 | 1 | True |
| 12c985b6-5506-4656-808b-cde996342518 | flavor2 | 1024 | 10 | 2 | 1 | True |
| 2 | m1.small | 2048 | 20 | 0 | 1 | True |
| 3 | m1.medium | 4096 | 40 | 0 | 2 | True |
| 36e8dc04-8957-48cd-8434-f6da50080173 | flavor1 | 1024 | 10 | 0 | 2 | True |
| 4 | m1.large | 8192 | 80 | 0 | 4 | True |
| 42 | m1.nano | 128 | 1 | 0 | 1 | True |
| 5 | m1.xlarge | 16384 | 160 | 0 | 8 | True |
| 84 | m1.micro | 192 | 1 | 0 | 1 | True |
| c1 | cirros256 | 256 | 1 | 0 | 1 | True |
| d1 | ds512M | 512 | 5 | 0 | 1 | True |
| d3 | ds2G | 2048 | 10 | 0 | 2 | True |
| d4 | ds4G | 4096 | 20 | 0 | 4 | True |

- 2.10. Show more details about **flavor2**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor show flavor2
```

| Field | Value |
|----------------------------|--------------------------------------|
| OS-FLV-DISABLED:disabled | False |
| OS-FLV-EXT-DATA:ephemeral | 2 |
| access_project_ids | None |

- 2.11. The **flavor1** flavor is no longer needed. Delete the **flavor1** flavor to demonstrate deletion from the command line.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor delete flavor1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor delete flavor1
[ubuntu@workstation (keystone-admin)]:~$
```

- 2.12.** Verify that **flavor1** has been deleted by listing all the available flavors and noting that **flavor1** does not appear on the list.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor list
```

| ID | Name | RAM | Disk | Ephemeral | VCPUs | Is Public |
|--------------------------------------|-----------|-------|------|-----------|-------|-----------|
| 1 | m1.tiny | 512 | 1 | 0 | 1 | True |

| d4 | ds4G | 4096 | 20 | 0 | 4 | True |

Tip

An alternative method is appending | **grep flavor1** to this command and noting that the output is empty.

Note

At the time of writing, there are no standard OpenStack commands to update a flavor after creation. Any changes will require deleting the flavor and remaking it.

- 2.13.** Leave the terminal window open and continue to the next task.

3 Managing Private Networks

In this task, you will manage networks and subnets with the *Horizon Dashboard* and *OpenStack Unified CLI*. You will create and delete networks and subnetworks, update their settings, and rename them.

- 3.1. Open the web browser, and navigate to **192.168.1.20**. Log in to the dashboard as the **admin** user with the password **secret**.
- 3.2. In this lab, we will create and manage our own networks, so any existing network can be safely deleted. First, select **demo** project. Then, navigate to **Project > Network > Networks**, select the **shared** network, and click **Delete Networks**.

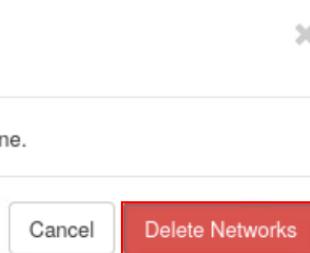

| Name | Subnets Associated | Shared | External | Status | Admin State | Availability Zones | Actions |
|--------------------------------------------|-----------------------------------------------------------------------|--------|----------|--------|-------------|--------------------|-------------------------------|
| <input checked="" type="checkbox"/> shared | shared-subnet 192.168.233.0/24 | Yes | No | Active | UP | - | <button>Edit Network</button> |
| <input type="checkbox"/> private | ipv6-private-subnet fd96:731b:22b0::/64 private-subnet 10.0.0.0/26 | No | No | Active | UP | - | <button>Edit Network</button> |
| <input type="checkbox"/> public | ipv6-public-subnet 2001:db8::/64 public-subnet 172.24.4.0/24 | No | Yes | Active | UP | - | <button>Edit Network</button> |

Tip

A network can also be deleted by selecting the dropdown next to the **Edit Network** button in the same row as the network, then clicking **Delete Network**.

- 3.3. Click **Delete Networks** in the **Confirm Delete Networks** dialog box to confirm deletion.

Confirm Delete Networks

- 3.4.** Now, we will create our own network and subnet. Navigate back to **Project > Network > Networks** and click **Create Network**.

The screenshot shows the OpenStack interface under the 'demo' project. The left sidebar has 'Compute', 'Volumes', and 'Network' sections. Under 'Network', there are 'Network Topology' and 'Routers' sections. The main area displays two networks: 'private' (IPv6-private-subnet) and 'public' (IPv6-public-subnet). A red box highlights the '+ Create Network' button at the top right of the network list.

- 3.5.** Enter **net1** in the *Network Name* field. Click **Next**.

Create Network

Network **Subnet** **Subnet Details**

- 3.14.** The name of a network can also be changed. To demonstrate this, change the name of the **net1** network to **net3**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack network set \
> --name net3 net1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack network set \
> --name net3 net1
[ubuntu@workstation (keystone-admin)]:~$ █
```

Note

The format of this instruction is

```
openstack network set --name <new_name> <old_name>
```

This follows the convention that the object being operated on is always the final argument of the command.

- 3.15.** Verify that the **net1** network has been successfully changed to **net3**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack network list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack network list
+-----+-----+
| ID      | Name   | Subnets
+-----+-----+
| 32da4c25-b517-40c5-97e3-cea031467d13 | public  | 4fc6bf88-919c-49df-83c4-b09bd65776ad, c7916655-8954-4bf4-913d-416702f35d1b |

| be5d9b78-36ea-4058-90e6-012d280f7dd7 | net3    | 73ceba28-9ffd-49ab-98b3-b3d54981d41e
+-----+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 3.16.** To avoid confusion, also rename **subnet1** to **subnet3**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet set \
> --name subnet3 subnet1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet set \
> --name subnet3 subnet1
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 3.17.** Update the **subnet3** subnet to disable DHCP.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet set \
> --no-dhcp subnet3
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet set \
> --no-dhcp subnet3
[ubuntu@workstation (keystone-admin)]:~$ █
```

Note

DHCP (Dynamic Host Configuration Protocol) is a network protocol that automatically assigns IP addresses to devices on a network. If this protocol is disabled for a subnet, instances will not automatically receive an IP address or a default gateway. This option can be useful when you want to set a static IP address or set these values yourself.

- 3.18.** Verify that the **subnet3** subnetwork has been correctly updated. The **enable_dhcp** property should be listed as **False**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet show subnet3
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack subnet show subnet3

- 3.23.** Leave the terminal window open and continue to the next task.

4 Launching an Internal Instance

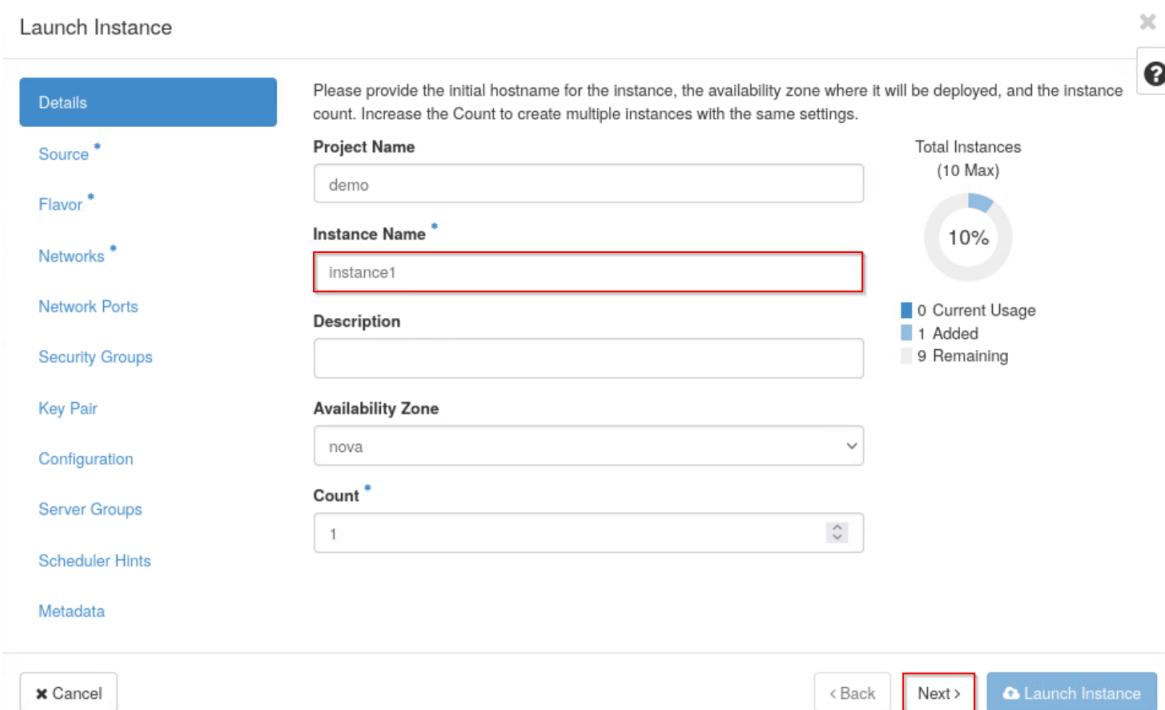

In this task, you will launch an internal instance with the *Horizon Dashboard*. You will then delete that instance and launch a new instance with the *OpenStack Unified CLI*.

- 4.1. Open the web browser, and navigate to **192.168.1.20**. Login as the **admin** user with the password **secret**.
- 4.2. Select **demo** project, and navigate to **Projects > Compute > Instances**. Click **Launch Instance**.

The screenshot shows the OpenStack Horizon Dashboard. The top navigation bar has 'openstack.' and 'demo' dropdowns. Below it, there's a 'Project / Compute / Instances' breadcrumb. On the left, a sidebar lists 'Project' (selected), 'Compute' (highlighted with a red box), 'Overview', 'Instances' (highlighted with a red box), 'Images', 'Key Pairs', 'Server Groups', 'Volumes', 'Network', 'Admin', and 'Identity'. The main content area is titled 'Instances' and shows a table with columns: Instance Name, Image Name, IP Address, Flavor, Key Pair, Status, Availability Zone, Task, Power State, Age, and Actions. A message at the bottom says 'No items to display.' At the top right of the main area are 'Instance ID' dropdown, 'Filter' button, and a 'Launch Instance' button (highlighted with a red box).

- 4.3. Enter **instance1** in the *Instance Name* field. Click **Next**.

The screenshot shows the 'Launch Instance' wizard. The first step, 'Details', is active. It includes fields for 'Source*', 'Flavor*', 'Networks*', 'Description', 'Availability Zone' (set to 'nova'), and 'Count*' (set to '1'). To the right, there's a circular progress bar labeled 'Total Instances (10 Max)' with '10%' completed. A legend indicates '0 Current Usage', '1 Added' (the current step), and '9 Remaining'. At the bottom are 'Cancel', '< Back', 'Next >', and a large 'Launch Instance' button (highlighted with a red box).

- 4.4.** Make sure **Image** is selected in the *Select Boot Source* dropdown, and click **No** under *Create New Volume*. Click the **↑** button on the same row as the **ubuntu2** image to allocate the image, and then click **Next**.

Displaying 12 items

< Back Next > Launch Instance

Stop

Verify that **flavor2** appears in the *Allocated* section before moving on to the next step.

Note

The warning signs in the *Root Disk* column indicate that the flavor in that row has a disk size less than the minimum size specified for the selected image.

- 4.6.** Click the ↑ button on the same row as the **net2** network, and click **Launch Instance**.

Launch Instance

| Network | Subnets Associated | Shared | Admin State | Status | |
|---------|---------------------------------------|--------|-------------|--------|---|
| net2 | subnet2 | No | Up | Active | ↑ |
| private | ipv6-private-subnet private-subnet | No | Up | Active | ↑ |

Stop

Verify that **net2** appears under the *Allocated* section. Wait for the instance to have a power state of **Running** before proceeding further.

- 4.7.** Log out of the *Horizon Dashboard* and close the web browser.

- 4.8.** If a terminal window is not already open, open one and source the `~/keystonerc-admin` file to load the **admin** user credentials.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 4.9. List the available instances and see that the instance created from the *Horizon Dashboard* appears.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
+-----+-----+-----+-----+-----+
| ID      | Name    | Status | Networks      | Image   | Flavor  |
+-----+-----+-----+-----+-----+
| b0db1d25-dd6c-47b9-907f-1c683e7a4856 | instance1 | ACTIVE | net2=192.168.1.38 | ubuntu2 | flavor2 |
+-----+-----+-----+-----+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 4.10. Now, we will recreate the instance from the CLI. First, delete the **instance1** instance.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server delete instance1
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server delete instance1
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 4.11. List the instances again to verify that **instance1** was deleted successfully.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
[ubuntu@workstation (keystone-admin)]:~$ █
```

- 4.12. Create a new instance named **instance2**. Use the previously created **ubuntu2** image, **flavor2** flavor, and **net2** network.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server create \
> --image ubuntu2 \
> --flavor flavor2 \
> --nic net-id=net2 \
> instance2
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server create \
> --image ubuntu2 \
> --flavor flavor2 \
> --nic net-id=net2 \
> instance2

[ubuntu@workstation (keystone-admin)]:~$ █
```

- 4.14. Leave the terminal window open and continue to the next task.

5 Verifying the Functionality of an Internal Instance

In this task, you will connect to the console of the instance you created previously and verify its flavor settings. You will also pause and stop the instance with the *OpenStack Unified CLI*.

- If a terminal window is not already open, open one and source the `~/keystonerc-admin` file to load the **admin** user credentials.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
[ubuntu@workstation (keystone-admin)]:~$ █
```

- List all the available instances to find the name of the running instance.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
+-----+-----+-----+-----+-----+
| ID      | Name     | Status   | Networks    | Image    | Flavor   |
+-----+-----+-----+-----+-----+
| bb55ad62-155b-4e29-92c8-cf58a2cc36c3 | instance2 | ACTIVE   | net2=192.168.1.228 | ubuntu2 | flavor2 |
+-----+-----+-----+-----+-----+
[ubuntu@workstation (keystone-admin)]:~$ █
```

- Show more details of the instance.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server show instance2
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server show instance2
+-----+-----+
| Field          | Value           |

[ubuntu@workstation (keystone-admin)]:~$ █
```

5.4. Review the specifications of the flavor2 flavor.

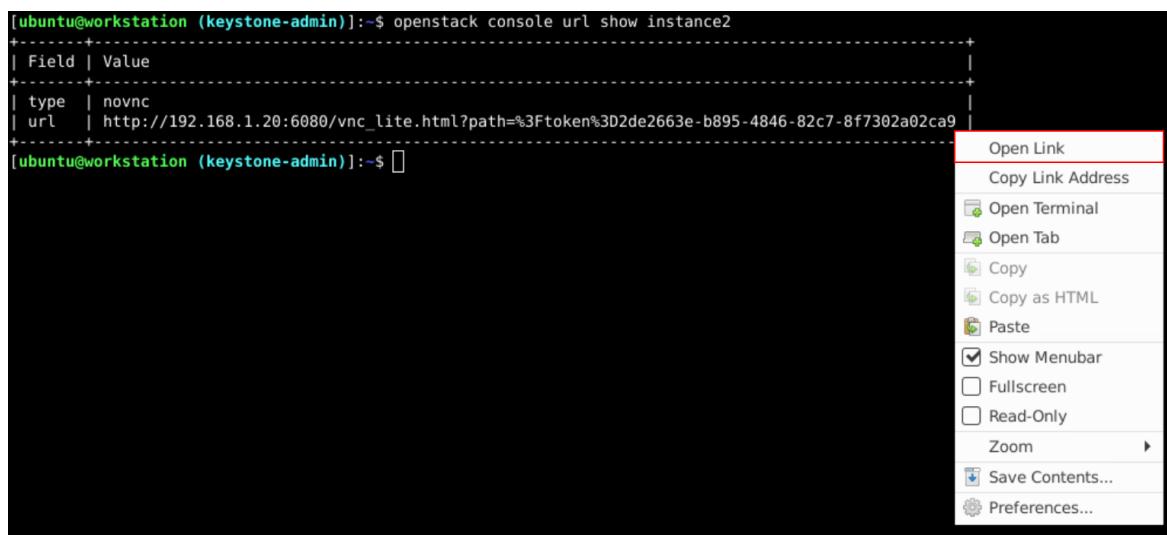

```
[ubuntu@workstation (keystone-admin)]:~$ openstack flavor show flavor2
```

| Field | Value |
|----------------------------|--------------------------------------|
| OS-FLV-DISABLED:disabled | False |
| OS-FLV-EXT-DATA:ephemeral | 2 |
| access_project_ids | None |
| disk | 10 |
| id | 641a6748-3495-4ca3-adeb-8304ab64053b |
| name | flavor2 |
| os-flavor-access:is_public | True |
| properties | |
| ram | 1024 |
| rxtx_factor | 1.0 |
| swap | 1024 |
| vcpus | 1 |

5.5. Retrieve the URL for the noVNC console connection. Right-click the link and select Open Link.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack console url show instance2
```

| Field | Value |
|-------|---------------------------------------------------------------------------------------------|
| type | novnc |
| url | http://192.168.1.20:6080/vnc_lite.html?path=%3Ftoken%3D2de2663e-b895-4846-82c7-8f7302a02ca9 |

- 5.6. Log in to **instance2** as **root** with the password **secret**.

```
Ubuntu 22.04.3 LTS instance2 tty1

instance2 login: root
Password: _
```

- 5.7. Use the **free** command to ensure that the RAM and swap amounts approximately match the one defined by **flavor2**, which is **1024 MB** for each.

```
root@instance2:~# free -m
```

```
root@instance2:~# free -m
      total        used        free      shared  buff/cache   available
Mem:       957         163         488          3         305         645
Swap:     1023           0        1023
root@instance2:~# _
```

Note

The amount of RAM on the system is given in the **Mem** row. The amounts shown in the output of this command will not exactly match the amounts specified by **flavor2** because a portion of the memory is reserved by the operating system.

- 5.8. Use the **df** command to ensure that the instance has disks of size **10 GB** and **2 GB**, as defined by **flavor2** for root and ephemeral disks, respectively. Notice that **/dev/vda1** is reported as nearly 10 GB, and **/dev/vdb** is exactly 2 GB.

```
root@instance2:~# df -h
```

```
root@instance2:~# df -h
Filesystem      Size  Used Avail Use% Mounted on
tmpfs            96M  976K  95M   1% /run
/dev/vda1        9.6G  1.5G  8.1G  15% /
tmpfs            479M    0  479M   0% /dev/shm
tmpfs            5.0M    0  5.0M   0% /run/lock
/dev/vda15       105M   6.1M  99M   6% /boot/efi
/dev/vdb          2.0G   24K  1.8G   1% /mnt
tmpfs            96M   4.0K  96M   1% /run/user/0
root@instance2:~#
```

Note

When the **-h** argument is passed, **df** reports sizes in a human-readable format by using units such as megabytes and gigabytes.

Note

The operating system also reserves a small portion of root disk space, which is why the root disk is reported as less than 10 GB. However, it does not reserve any space from ephemeral disk, so it is reported as exactly the right size.

- 5.9.** Determine the number of CPUs that the instance is using. Ensure the number matches the number of VCPUs defined by **flavor2**, which is **1**. Notice that under the **Architecture** heading at the top of the command output, there is a **CPU(s)** heading, whose value is **1**.

```
root@instance2:~# lscpu
```

```
root@instance2:~# lscpu
Architecture:          x86_64
CPU op-mode(s):        32-bit, 64-bit
Address sizes:         40 bits physical, 48 bits virtual

root@instance2:~#
```

- 5.10.** Use the **ping** command from the instance to reach the DHCP server defined for the network. Leave the **ping** command running, as it will be used in the following steps. Recall that the network for this instance (**net2**) is *not* the one on which you disabled DHCP (**net3**).

```
root@instance2:~# ping -c3 192.168.1.2
```

```
root@instance2:~# ping 192.168.1.2
PING 192.168.1.2 (192.168.1.2) 56(84) bytes of data.
64 bytes from 192.168.1.2: icmp_seq=1 ttl=64 time=4.83 ms
64 bytes from 192.168.1.2: icmp_seq=2 ttl=64 time=0.742 ms
64 bytes from 192.168.1.2: icmp_seq=3 ttl=64 time=0.456 ms
```

Note

You should receive 3 successful ping replies.

- 5.11.** Close the web browser and switch focus to the terminal on **workstation**.

- 5.12.** List the current OpenStack instances.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
```

| ID | Name | Status | Networks | Image | Flavor |
|--------------------------------------|-----------|--------|--------------------|---------|---------|
| bb55ad62-155b-4e29-92c8-cf58a2cc36c3 | instance2 | ACTIVE | net2=192.168.1.228 | ubuntu2 | flavor2 |

- 5.13.** Delete **instance2**.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server delete instance2
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server delete instance2
[ubuntu@workstation (keystone-admin)]:~$
```

- 5.14.** List all available instances to verify the **instance2** instance has been deleted.

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
```

```
[ubuntu@workstation (keystone-admin)]:~$ openstack server list
[ubuntu@workstation (keystone-admin)]:~$
```

- 5.15.** Close the terminal window and the web browser.

- 5.16.** The lab is now complete.
