## Introduction

In this lab, you will manage external networks, floating IP addresses, implement security, and launch an external instance.

## Objectives

- Manage external networks.
- Manage OpenStack routers.
- Manage floating IP addresses.
- Manage SSH key pairs and security groups.
- Launch and verify an external instance.

## Lab Settings

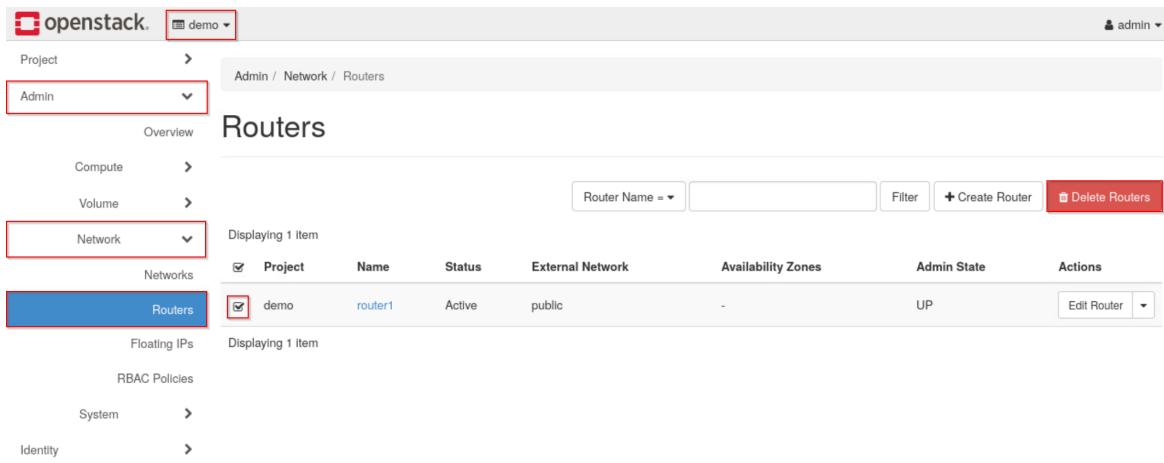

The information in the table below will be needed in order to complete the lab. The task sections below provide details on the use of this information.

Virtual Machine	IP Address	Account	Password
workstation	ens3: 192.168.1.20 ens4: 172.25.250.20	ubuntu	ubuntu
devstack	ens3: 192.168.1.21 ens4: 172.25.250.21	ubuntu	ubuntu

# 1 Managing External Networks

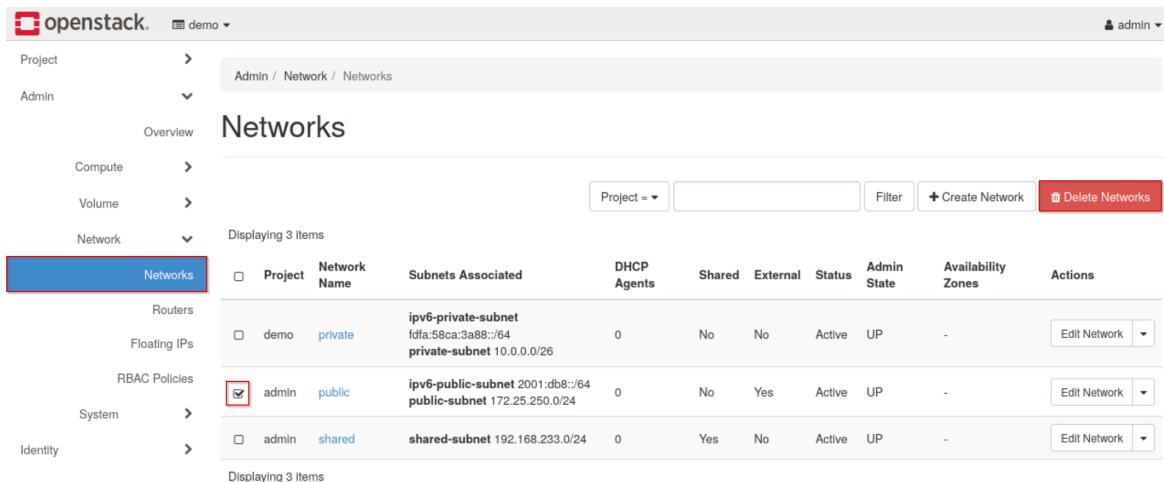

In this task, you will use the *Horizon Dashboard* and the **OpenStack Unified CLI** to create and configure an external network.

1. Open the web browser. Navigate to **192.168.1.20** and log in to the dashboard as **admin** with the password **secret**.
2. Switch to the **demo** project. Navigate to **Admin**→**Network**→**Routers**. Check the box in the same row as **router1**, then click **Delete Routers**.

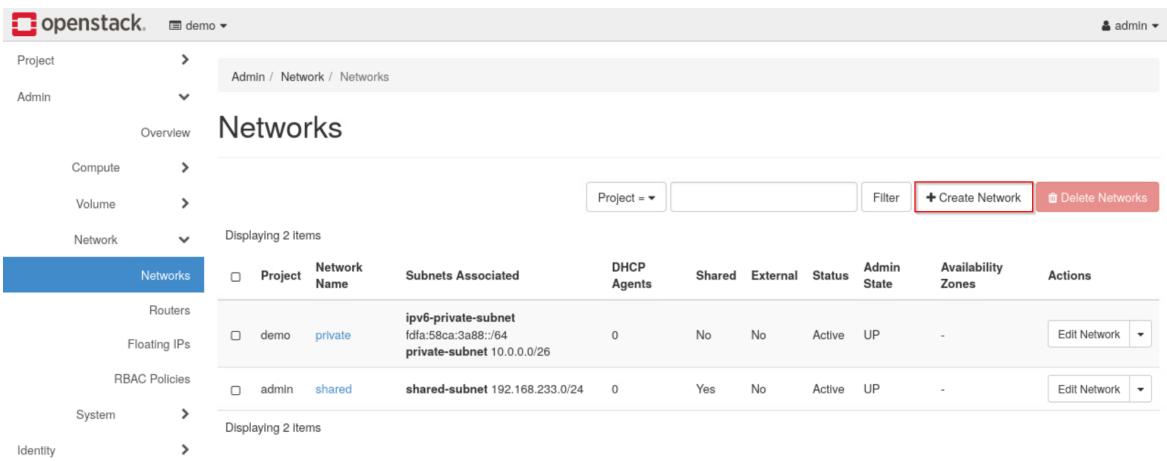

Project	Name	Status	External Network	Availability Zones	Admin State	Actions
demo	router1	Active	public	-	UP	<a href="#">Edit Router</a>

3. Now, navigate to **Networks**. Check the box in the same row as **public**, then click **Delete Networks**.

Project	Network Name	Subnets Associated	DHCP Agents	Shared	External	Status	Admin State	Availability Zones	Actions
demo	private	ipv6-private-subnet fd1a:58ca:3a88::/64 private-subnet 10.0.0.0/26	0	No	No	Active	UP	-	<a href="#">Edit Network</a>
admin	public	ipv6-public-subnet 2001:db8::/64 public-subnet 172.25.250.0/24	0	No	Yes	Active	UP	-	<a href="#">Edit Network</a>
admin	shared	shared-subnet 192.168.233.0/24	0	Yes	No	Active	UP	-	<a href="#">Edit Network</a>

4. Click **Create Network**.

The screenshot shows the OpenStack Admin interface under the 'Network / Networks' section. The left sidebar has 'Project' and 'Admin' sections. Under 'Admin', 'Compute', 'Volume', and 'Network' are listed. 'Network' is expanded, showing 'Routers', 'Floating IPs', 'RBAC Policies', 'System', and 'Identity' sections. The main area is titled 'Networks' and displays a table with two items:

Project	Network Name	Subnets Associated	DHCP Agents	Shared	External	Status	Admin State	Availability Zones	Actions
demo	private	ipv6-private-subnet fdca:58ca:3a88::/64 private-subnet 10.0.0.0/26	0	No	No	Active	UP	-	<button>Edit Network</button>
admin	shared	shared-subnet 192.168.233.0/24	0	Yes	No	Active	UP	-	<button>Edit Network</button>

- Enter **net1** in the *Network Name* field.
- Select **demo** in the *Project* dropdown.
- For *Provider Network Type*, select **Flat**.
- Enter **public** into the *Physical Network* field.
- Check the *Shared* and *External Network* check boxes, and ensure the *Create Subnet* check box is checked.
- Click **Next** to go to the *Subnet* tab.

## Create Network

Network \*

6. In the *Subnet* tab, enter **subnet1** in the *Subnet Name* field, and enter **172.25.250.0/24** in the *Network Address* field. Click **Next** to go to the *Subnet Details* tab.

## Create Network

Network \*

Subnet

Subnet Details

**Subnet Name**

subnet1

**Network Address Source**

Enter Network Address manually

Creates a subnet associated with the network. You need to enter a valid "Network Address" and "Gateway IP". If you did not enter the "Gateway IP", the first value of a network will be assigned by default. If you do not want gateway please check the "Disable Gateway" checkbox. Advanced configuration is available by clicking on the "Subnet Details" tab.

**Network Address ?**

172.25.250.0/24

**IP Version**

IPv4

**Gateway IP ?** Disable Gateway[Cancel](#)[« Back](#)[Next »](#)

7. In the *Subnet Details* tab, uncheck the *Enable DHCP* check box. Enter **172.25.250.5**, **172.25.250.100** in the *Allocation Pools* field. Click **Create** to create the network and subnet.

## Create Network

Network \* Subnet Subnet Details

**Enable DHCP**

Specify additional attributes for the subnet.

**Allocation Pools** ②  
172.25.250.5,172.25.250.100

**DNS Name Servers** ②

**Host Routes** ②

Cancel « Back **Create**

8. Log out of the *Horizon Dashboard* and close the web browser.
9. Open a terminal window and source the keystone credentials for the **admin** user.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
ubuntu@workstation:~$ 
```

10. Delete the **subnet1** subnet.

```
ubuntu@workstation:~$ openstack subnet delete subnet1
```

```
ubuntu@workstation:~$ openstack subnet delete subnet1
ubuntu@workstation:~$ 
```

11. Delete the **net1** network.

```
ubuntu@workstation:~$ openstack network delete net1
```

```
ubuntu@workstation:~$ openstack network delete net1
ubuntu@workstation:~$ █
```

12. Create an external network named **external**. Set the network type to **flat** and the physical network to **public**. Set the network as shared and external.

```
ubuntu@workstation:~$ openstack network create external \
> --external --share \
> --provider-network-type flat \
> --provider-physical-network public
```

```
ubuntu@workstation:~$ openstack network create external \
> --external --share \
> --provider-network-type flat \
> --provider-physical-network public

14. Leave the terminal window open and continue to the next task.

## 2 Preparing OpenStack Routers to Deploy an Instance

In this task, you will create and configure a router using the *Horizon Dashboard* and *OpenStack Unified CLI* and use command line tools to test the connectivity of the router.

1. Open the web browser and navigate to **192.168.1.20**. Log into the dashboard as **admin** with the password **secret**.
2. Switch to the **demo** project and navigate to **Project→Network→Routers**. Click **Create Router** to create a new router.

3. Enter **router1** in the *Router Name* field and select **external** in the *External Network* dropdown. Click **Create Router**.

Name	Description
Router Name	Creates a router with specified parameters.
Enable Admin State	<input checked="" type="checkbox"/>
External Network	Enable SNAT will only have an effect if an external network is set.
Availability Zone Hints	

4. Click the router name, **router1**, to access its details.

The screenshot shows a table with the following columns: Name, Status, External Network, Admin State, Availability Zones, and Actions. The 'Name' column contains a link to 'router1', which is highlighted with a red box. The 'Status' column shows 'Active'. The 'External Network' column shows 'external'. The 'Admin State' column shows 'UP'. The 'Actions' column contains a 'Clear Gateway' button. The top navigation bar includes 'Router Name' dropdown, 'Filter' button, '+ Create Router' button, and a 'Delete Routers' button.

Name	Status	External Network	Admin State	Availability Zones	Actions
<a href="#">router1</a>	Active	external	UP	-	<a href="#">Clear Gateway</a>

5. Click the **Interfaces** tab to manage the interfaces for the router. Click **Add Interface** to add a new interface.

The screenshot shows the 'router1' details page with the 'Interfaces' tab selected. Below the tabs are three buttons: '+ Add Interface' (highlighted with a red box), 'Delete Interfaces', and 'Clear Gateway'. The main table has columns: Name, Fixed IPs, Status, Type, Admin State, and Actions. It lists one item: '(d30b316e-659c)' with '172.25.250.68' as the Fixed IP, 'Active' status, 'External Gateway' type, and 'UP' Admin State. A 'Delete Interface' button is visible in the Actions column.

Name	Fixed IPs	Status	Type	Admin State	Actions
(d30b316e-659c)	172.25.250.68	Active	External Gateway	UP	<a href="#">Delete Interface</a>

6. Select **shared: 172.25.233.0/24 (shared-subnet)** from the *Subnet* dropdown and click **Submit** to add the interface.

The 'Add Interface' dialog box is shown. The 'Subnet' dropdown is set to 'shared: 192.168.233.0/24 (shared-subnet)', which is highlighted with a red box. The 'IP Address (optional)' field is empty. To the right, a 'Description' section explains that if no IP is specified, the gateway's IP of the selected subnet will be used. At the bottom are 'Cancel' and 'Submit' buttons, with 'Submit' highlighted with a red box.

**Subnet \***  
shared: 192.168.233.0/24 (shared-subnet)

**Description:**  
You can connect a specified subnet to the router.  
If you don't specify an IP address here, the gateway's IP address of the selected subnet will be used as the IP address of the newly created interface of the router. If the gateway's IP address is in use, you must use a different address which belongs to the selected subnet.

Cancel **Submit**

7. Log out of the dashboard and close the web browser.  
8. Open a terminal window if one is not already open, and source the **admin** credentials.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
ubuntu@workstation:~$ █
```

9. Show the details of **router1**. Copy the `subnet_id` from the `interfaces_info` row of the output.

```
ubuntu@workstation:~$ openstack router show router1
```

```
ubuntu@workstation:~$ openstack router show router1

ubuntu@workstation:~$ █
```

### Tip

You can copy from the terminal to the clipboard the keyboard shortcut **Ctrl+Shift+C**.

10. Delete the interface in the **shared** subnet for the **router1** router using the command below. Substitute the subnet ID with the one you copied previously. Make sure not to include any characters besides numbers and hyphens.

```
ubuntu@workstation:~$ openstack router remove subnet router1 \
> 85998680-f76d-4cba-887c-f4946a26e071
```

```
ubuntu@workstation:~$ openstack router remove subnet router1 \
> 85998680-f76d-4cba-887c-f4946a26e071
ubuntu@workstation:~$ █
```

### Tip

You can paste from the clipboard into the terminal with the keyboard shortcut **Ctrl+Shift+V**.

11. Unset the **external** network as the gateway for the router.

```
ubuntu@workstation:~$ openstack router unset --external-gateway router1
```

```
ubuntu@workstation:~$ openstack router unset --external-gateway router1
ubuntu@workstation:~$ █
```

12. Delete the **router1** router.

```
ubuntu@workstation:~$ openstack router delete router1
```

```
ubuntu@workstation:~$ openstack router delete router1
ubuntu@workstation:~$ █
```

13. Create a router named **exercise-router**.

```
ubuntu@workstation:~$ openstack router create exercise-router
```

```
ubuntu@workstation:~$ openstack router create exercise-router

```

19. Exit the SSH session.

```
ubuntu@workstation:~$ exit
```

```
ubuntu@devstack:~$ exit
logout
Connection to 192.168.1.20 closed.
ubuntu@workstation:~$ ~█
```

20. Leave the terminal window open and continue to the next task.

### 3 Maintaining Floating IP Addresses

In this task, you will create a set of floating IP addresses and allocate them to an instance.

1. If a terminal window is not already open, open one and source the admin credentials from the `~/keystonerc-admin` file.
2. Create a new instance named `instance1`. Use the `ubuntu` image, `m1.small` flavor, and `shared` network.

```
ubuntu@workstation:~$ openstack server create \
> --image ubuntu \
> --flavor m1.small \
> --nic net-id=shared \
> --wait instance1
```

```
ubuntu@workstation:~$ openstack server create \
> --image ubuntu \
> --flavor m1.small \
> --nic net-id=shared \
> --wait instance1

ubuntu@workstation:~$
```

3. Leave the terminal window open and open the web browser. Navigate to **192.168.1.20**. Log into the *Horizon Dashboard* as the **admin** user with the password **secret**.
4. Switch to the **demo** project. Navigate to **Project**→**Network**→**Floating IPs**. Click **Allocate IP to Project**.

The screenshot shows the OpenStack dashboard for the 'demo' project. The sidebar on the left has a 'Network' dropdown menu open, with 'Floating IPs' highlighted. The main content area is titled 'Floating IPs' and displays a table with columns: IP Address, Description, DNS Name, DNS Domain, Mapped Fixed IP Address, Pool, Status, and Actions. A red box highlights the 'Allocate IP To Project' button at the top right of the table.

5. Ensure **external** is set as the *Pool*. Click **Allocate IP**.

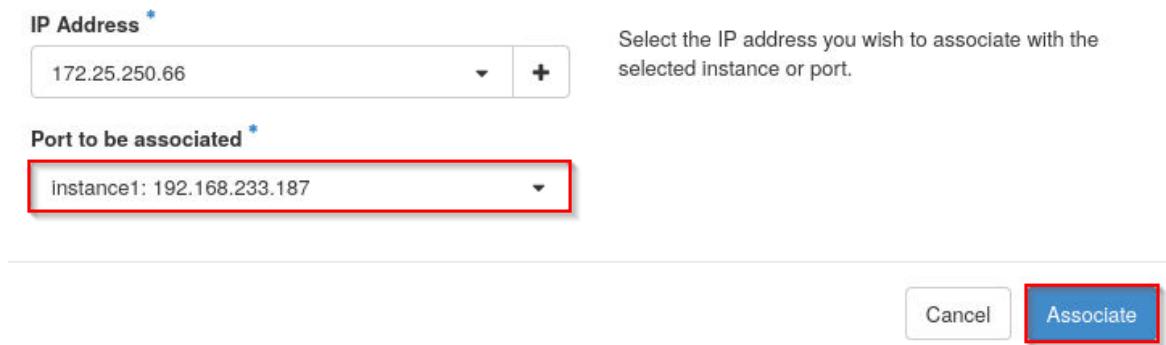

The screenshot shows the 'Allocate Floating IP' dialog box. It includes fields for 'Pool' (set to 'external'), 'Description' (empty), 'DNS Domain' (empty), and 'DNS Name' (empty). On the right, there's a 'Description:' label with a tooltip, 'Project Quotas' section, and a 'Allocate IP' button at the bottom right which is highlighted with a red box.

6. Click **Associate** in the row of the floating IP address.

The screenshot shows the 'Floating IPs' page with one item listed. The item has an IP address of 172.25.250.66, a status of 'Down', and a 'Pool' of 'external'. The 'Associate' button in the 'Actions' column is highlighted with a red box.

7. In the *Port to be associated* dropdown, select **instance1: 192.168.233.XYZ**. Click **Associate**.

## Manage Floating IP Associations

**IP Address \***  
172.25.250.66

**Port to be associated \***  
instance1: 192.168.233.187

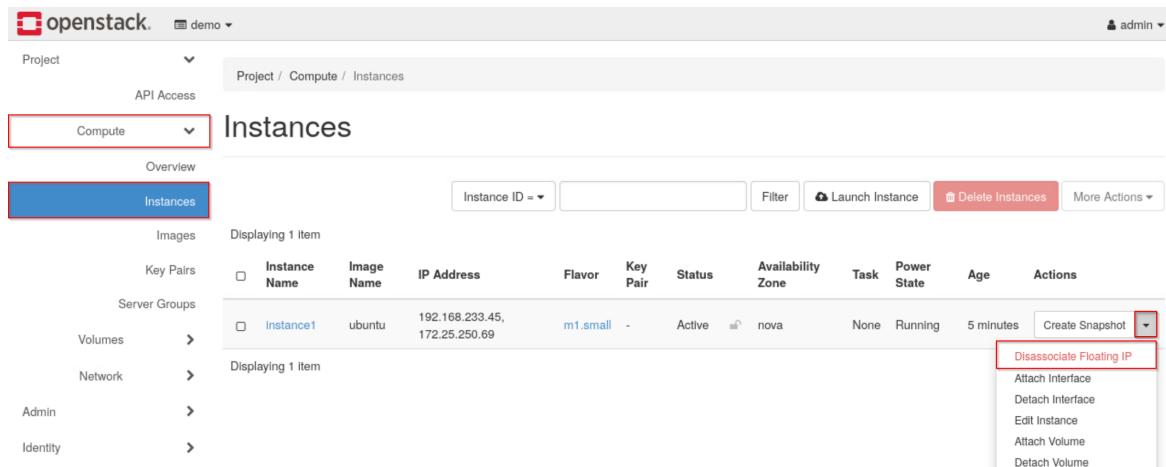

Select the IP address you wish to associate with the selected instance or port.

Cancel **Associate**

### Note

The actual value of the floating IP address may differ.

8. Navigate to **Compute**→**Instances**. Click the arrow next to the **Create Snapshot** in the same as **instance1**. Select **Disassociate Floating IP** to detach the floating IP from the instance.

Project / Compute / Instances

+-----+-----+
ubuntu@workstation:~$
```

15. Associate the third floating IP with **instance1**.

```
ubuntu@workstation:~$ openstack server add \  
> floating ip instance1 172.25.250.74
```

```
ubuntu@workstation:~$ openstack server add \  
> floating ip instance1 172.25.250.74  
ubuntu@workstation:~$ █
```

Note

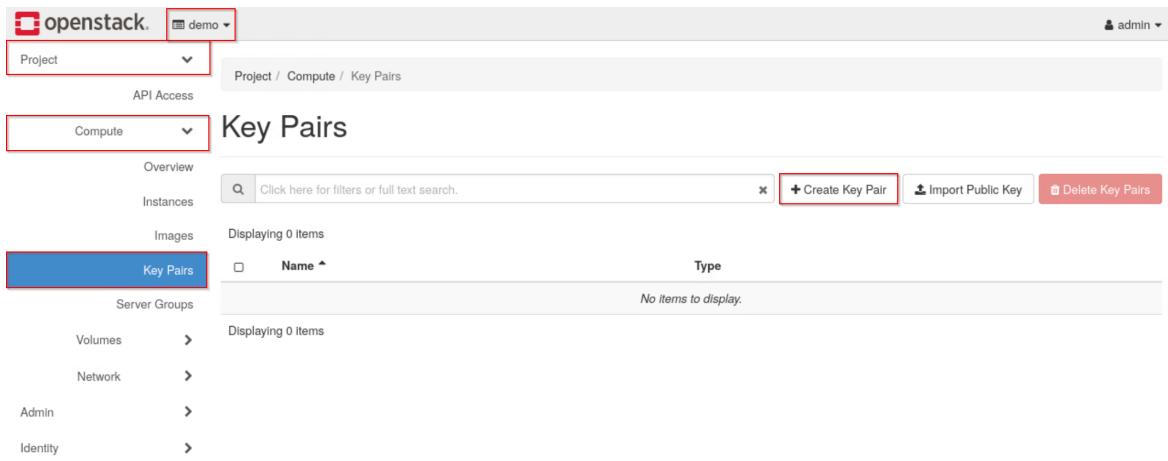

The actual floating IP may differ. Use the floating IP address generated from your output from the previous step.

16. Leave the terminal window open and continue to the next task.

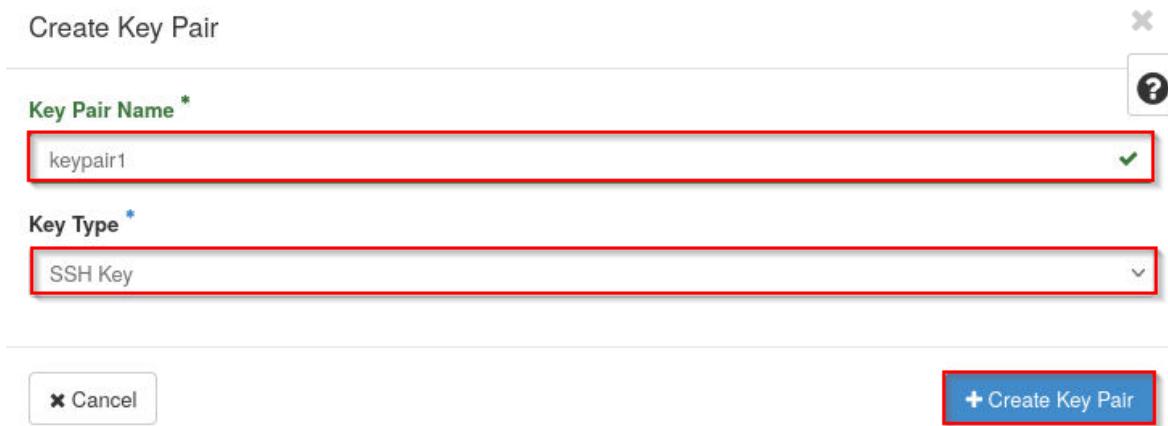

## 4 Implementing Security

In this task, you will use the *Horizon Dashboard* and *OpenStack Unified CLI* to manage SSH key pairs and security groups for OpenStack instances.

1. Open the web browser and navigate to **192.168.1.20**. Log into the dashboard as **admin** with the password **secret**.
2. Switch to the **demo** project and navigate to **Project→Compute→Key Pairs**. Click **Create Key Pair** to create a new key pair.

3. Enter **keypair1** in the *Key Pair Name* field, and select **SSH Key** in the *Key Type* dropdown. Click **Create Key Pair**. This will create the key pair and download it to the **~/Downloads** directory.

4. Navigate to **Network→Security Groups** and click **Create Security Group**.

Project / Network / Security Groups

## Security Groups

Name	Security Group ID	Description	Shared	Actions
default	9e3ffbc... c073-456c-b78f-67b619a1f27e	Default security group	False	<a href="#">Manage Rules</a>

5. Enter **secgroup1** into the *Name* field and click **Create Security Group**.

Name \*

Description

Description:  
Security groups are sets of IP filter rules that are applied to network interfaces of a VM. After the security group is created, you can add rules to the security group.

**Create Security Group**

6. After creating the security group, you should land on the page containing the rules for the security group. If not, click **Manage Rules** in the same column as **secgroup1** on the **Security Groups** page to get there. Click **Add Rule** to add a new rule in the security group.

Project / Network / Security Groups / Manage Security Group Rule...

### Manage Security Group Rules: secgroup1 (287ccaa3-61ad-447d-8f6e-0f81d14c67dd)

Direction	Ether Type	IP Protocol	Port Range	Remote IP Prefix	Remote Security Group	Description	Actions
Egress	IPv4	Any	Any	0.0.0.0/0	-	-	<a href="#">Delete Rule</a>
Egress	IPv6	Any	Any	::/0	-	-	<a href="#">Delete Rule</a>

7. Select **All ICMP** from the *Rule* dropdown and click **Add**. This will allow ICMP traffic, namely the ping command, to reach instances in this security group.

## Add Rule

**Rule \***

All ICMP

**Description** ?

**Direction**

Ingress

**Remote \*** ?

CIDR

**CIDR** ?

0.0.0.0/0

### Description:

Rules define which traffic is allowed to instances assigned to the security group. A security group rule consists of three main parts:

**Rule:** You can specify the desired rule template or use custom rules, the options are Custom TCP Rule, Custom UDP Rule, or Custom ICMP Rule.

**Open Port/Port Range:** For TCP and UDP rules you may choose to open either a single port or a range of ports. Selecting the "Port Range" option will provide you with space to provide both the starting and ending ports for the range. For ICMP rules you instead specify an ICMP type and code in the spaces provided.

**Remote:** You must specify the source of the traffic to be allowed via this rule. You may do so either in the form of an IP address block (CIDR) or via a source group (Security Group). Selecting a security group as the source will allow any other instance in that security group access to any other instance via this rule.

Cancel

Add

8. Log out of the *Horizon Dashboard* and close the web browser.
9. If a terminal window is not already open, open one and source the **admin** credentials from the `~/keystonerc-admin` file.
10. Delete the private key located at `~/Downloads/keypair1.pem`.

```
ubuntu@workstation:~$ rm -f ~/Downloads/keypair1.pem
```

```
ubuntu@workstation:~$ rm -f ~/Downloads/keypair1.pem
ubuntu@workstation:~$
```

11. Delete the **keypair1** key pair.

```
ubuntu@workstation:~$ openstack keypair delete keypair1
```

```
ubuntu@workstation:~$ openstack keypair delete keypair1
ubuntu@workstation:~$
```

12. List the rules in the **secgroup1** security group.

```
ubuntu@workstation:~$ openstack security group rule \
> list secgroup1
```

```
ubuntu@workstation:~$ openstack security group rule \
> list secgroup1
+-----+-----+-----+-----+
| ID      | IP Protocol | IP Range | Port Range | Remote Security Group |
+-----+-----+-----+-----+
| 3027b819-ceaf-43e9-a556-9f4b622d6806 | None       | None     |           | None
| 7070ffa9-0746-4ac1-a504-99356ebdf2cf | None       | None     |           | None
| c92f0fdb-65b0-49ba-ae54-e9ec13ac98c1 | icmp      | 0.0.0.0/0 |           | None
+-----+-----+-----+-----+
ubuntu@workstation:~$
```

13. Use the *ID* for the ICMP rule to delete that rule.

```
ubuntu@workstation:~$ openstack security group rule \
> delete c92f0fdb-65b0-ae54-e9ec13ac98c1
```

```
ubuntu@workstation:~$ openstack security group rule delete c92f0fdb-65b0-49ba-ae54-e9ec13ac98c1
ubuntu@workstation:~$
```

#### Note

The actual ID value may differ.

14. Delete the **secgroup1** security group.

```
ubuntu@workstation:~$ openstack security group \
> delete secgroup1
```

```
ubuntu@workstation:~$ openstack security group \
> delete secgroup1
ubuntu@workstation:~$
```

15. Create the key pair **dev-keypair** and save the private key to the file **~/Downloads/dev-keypair.pem**.

```
ubuntu@workstation:~$ openstack keypair create \
> dev-keypair > ~/Downloads/dev-keypair.pem
```

```
ubuntu@workstation:~$ openstack keypair create \
> dev-keypair > ~/Downloads/dev-keypair.pem
ubuntu@workstation:~$
```

16. the chmod command with a mode of **600** to make it so that the **ubuntu** user has read/write permissions on the file, and groups and other users have no permissions to the file.

```
ubuntu@workstation:~$ chmod 600 ~/Downloads/dev-keypair.pem
```

```
ubuntu@workstation:~$ chmod 600 ~/Downloads/dev-keypair.pem
ubuntu@workstation:~$ █
```

17. Create the **dev-secgroup** security group.

```
ubuntu@workstation:~$ openstack security group \
> create dev-secgroup
```

```
ubuntu@workstation:~$ openstack security group \
> create dev-secgroup

Displaying 1 item

30. Click **Delete Instances** to confirm the deletion of **instance1**.

### Confirm Delete Instances

You have selected: "instance1". Please confirm your selection. Deleted instances are not recoverable.

31. Close the web browser and continue to the next task.

## 5 Launching an External Instance

In this task, you will launch an external instance.

1. If a terminal window is not already open, open one and source the admin credentials from the `~/keystonerc-admin` file.
2. List all instances in the project. The list should be empty.

```
ubuntu@workstation:~$ openstack server list
```

```
ubuntu@workstation:~$ openstack server list

ubuntu@workstation:~$ █
```

3. Launch an instance named `instance-external` using the `ubuntu` image, the `m1.small` flavor, the `dev-keypair` key pair, the `shared` network, and the `dev-secgroup` security group.

```
ubuntu@workstation:~$ openstack server create \
> --image ubuntu \
> --flavor m1.small \
> --key-name dev-keypair \
> --nic net-id=shared \
> --security-group dev-secgroup \
> --wait instance-external
```

```
ubuntu@workstation:~$ openstack server create \
> --image ubuntu \
> --flavor m1.small \
> --key-name dev-keypair \
> --nic net-id=shared \
> --security-group dev-secgroup \
> --wait instance-external

+-----+-----+
ubuntu@workstation:~$ 
```

- Set the **external** network as the gateway for the **exercise-router** router.

```
ubuntu@workstation:~$ openstack router set \
> --external-gateway external \
> exercise-router 
```

```
ubuntu@workstation:~$ openstack router set \
> --external-gateway external \
> exercise-router
ubuntu@workstation:~$ 
```

- Create a floating IP address for the project.

```
ubuntu@workstation:~$ openstack floating ip create external 
```

ubuntu@workstation:~\$ openstack floating ip create external	
Field	Value
created_at	2023-11-21T22:54:54Z
description	
fixed_ip_address	None
floating_ip_address	172.25.250.66
floating_network_id	f940f9bd-6695-427b-8598-09a12672e9cc

project_id	c524eaead1f74d4f9141f71b280e0237
qos_policy_id	None
revision_number	0
router_id	None
status	DOWN
subnet_id	None
updated_at	2023-11-21T22:54:58Z

7. Create a third floating IP address for the project.

```
ubuntu@workstation:~$ openstack floating ip create external
```

```
ubuntu@workstation:~$ openstack floating ip create external
+-----+-----+
| Field | Value |
+-----+-----+
| created_at | 2023-11-21T22:55:00Z |
| description | |
| fixed_ip_address | None |
| floating_ip_address | 172.25.250.74 |
| floating_network_id | f940f9bd-6695-427b-8598-09a12672e9cc |
| id | 49152876-3b61-40ab-9b24-1f0b67df3f7b |

| status | DOWN |
| subnet_id | None |
| updated_at | 2023-11-21T22:55:00Z |
+-----+
ubuntu@workstation:~$
```

- Associate the third floating IP address with the **instance-external** instance.

```
ubuntu@workstation:~$ openstack server add floating ip \
> instance-external 172.25.250.74
```

```
ubuntu@workstation:~$ openstack server add floating ip \
> instance-external 172.25.250.74
ubuntu@workstation:~$
```

**Note**

Be sure to use the floating IP address that matches your output as they may differ slightly from this example.

- Verify that the instance was assigned the floating IP address.

```
ubuntu@workstation:~$ openstack server list \
> -c Name \
> -c Networks
```

```
ubuntu@workstation:~$ openstack server list \
> -c Name \
> -c Networks
+-----+-----+
| Name | Networks |
+-----+-----+
| instance-external | shared=192.168.233.208, 172.25.250.74 |
+-----+-----+
ubuntu@workstation:~$ █
```

**Tip**

For commands that output tables, you can pull out only the columns you want by using the `-c` option followed by the column name. This option can be chained as in the command above to list multiple columns.

10. Leave the terminal window open and continue to the next task.

## 6 Verifying an External Instance

In this task, you will verify the functionality of an external instance by using the ssh and ping commands to test the external network.

1. If a terminal window is not already open, open one and source the admin credentials from the `~/keystonerc-admin` file.
2. Use the `scp` command to send the `dev-keypair` key pair to the `devstack` machine over the SSH protocol.

```
ubuntu@workstation:~$ scp ~/Downloads/dev-keypair.pem \
> ubuntu@192.168.1.20:~/dev-keypair.pem
```

```
ubuntu@workstation:~$ scp ~/Downloads/dev-keypair.pem \
> ubuntu@192.168.1.20:~/dev-keypair.pem
ubuntu@192.168.1.20's password:
dev-keypair.pem                                              100% 1680      4.8MB/s   00:00
ubuntu@workstation:~$ █
```

3. SSH into the `devstack` machine.

```
ubuntu@workstation:~$ ssh 192.168.1.20
```

```
ubuntu@workstation:~$ ssh 192.168.1.20
ubuntu@192.168.1.20's password:
Welcome to Ubuntu 22.04.3 LTS (GNU/Linux 5.15.0-1046-kvm x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

 * Strictly confined Kubernetes makes edge and IoT secure. Learn how MicroK8s
 just raised the bar for easy, resilient and secure K8s cluster deployment.

 https://ubuntu.com/engage/secure-kubernetes-at-the-edge

This system has been minimized by removing packages and content that are
not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.

Expanded Security Maintenance for Applications is not enabled.

0 updates can be applied immediately.

Enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

The list of available updates is more than a week old.
To check for new updates run: sudo apt update
Last login: Tue Nov 21 22:27:04 2023 from 192.168.1.254
ubuntu@devstack:~$ █
```

4. Ping the **external-instance** instance using the floating IP that was assigned to it in the previous task.

```
ubuntu@devstack:~$ ping -c3 172.25.250.74
```

```
ubuntu@devstack:~$ ping -c3 172.25.250.74
PING 172.25.250.74 (172.25.250.74) 56(84) bytes of data.
64 bytes from 172.25.250.74: icmp_seq=1 ttl=63 time=2.31 ms
64 bytes from 172.25.250.74: icmp_seq=2 ttl=63 time=0.962 ms
64 bytes from 172.25.250.74: icmp_seq=3 ttl=63 time=0.820 ms

--- 172.25.250.74 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2002ms
rtt min/avg/max/mdev = 0.820/1.362/2.306/0.669 ms
ubuntu@devstack:~$ █
```

5. SSH into the **instance-external** instance, using the **dev-keypair.pem** file to authenticate.

```

ubuntu@devstack:~$ ssh -i ~/dev-keypair.pem \
> 172.25.250.74
