**Lab 05: Customizing Instances**

## Contents

Introduction .....	2
Objectives .....	3
Lab Settings.....	4
1 Creating Customized Instances .....	5
2 Verify Customized Instances .....	26

## Introduction

In this lab, you will use the `cloud-init` utility to customize OpenStack instances.

## Objectives

- Customize an instance with cloud-init.
- Verify instance customization.

## Lab Settings

The information in the table below will be needed in order to complete the lab. The task sections below provide details on the use of this information.

Virtual Machine	IP Address	Account	Password
workstation	ens3: 192.168.1.21 ens4: 172.25.250.21	ubuntu	ubuntu
devstack	ens3: 192.168.20 ens4: 172.25.250.20	ubuntu	ubuntu

## 1 Creating Customized Instances

In this task, you will customize two instances using cloud-init capabilities and features. You will log into the first instance to confirm cloud-init is up and running.

- 1.1. Log into the **workstation** machine as the **ubuntu** user with password **ubuntu**.

```
Ubuntu 18.04.6 LTS workstation tty1

workstation login: ubuntu
Password:
```

- 1.2. Launch the graphical user interface.

```
ubuntu@workstation:~$ startx
```

```
Welcome to Ubuntu 18.04.6 LTS (GNU/Linux 4.15.0-213-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

 System information as of Fri Jun  7 21:01:55 UTC 2024

 System load:  0.6              Processes:           197
 Usage of /:   7.9% of 116.12GB  Users logged in:      0
 Memory usage: 13%            IP address for ens3: 192.168.1.21
 Swap usage:   0%            IP address for ens4: 172.25.250.21

 Expanded Security Maintenance for Infrastructure is not enabled.

 2 updates can be applied immediately.
 To see these additional updates run: apt list --upgradable

 146 additional security updates can be applied with ESM Infra.
 Learn more about enabling ESM Infra service for Ubuntu 18.04 at
 https://ubuntu.com/18-04

ubuntu@workstation:~$ startx_
```

- 1.3. Open the web browser and navigate to **192.168.1.20**. Log into the dashboard as **admin** with the password **secret**.
- 1.4. Switch to the **demo** project. Navigate to **Admin > Network > Routers**. Check the box in the same row as **router1**, then click **Delete Routers**.

The screenshot shows the OpenStack interface under the 'demo' project. The left sidebar has 'Network' selected. The main area is titled 'Routers' and displays one item: 'demo' (router1), which is active and connected to the 'public' external network. A red box highlights the 'Router Name' column header.

- 1.5.** In the *Confirm Delete Routers* dialog box that pops up, click **Delete Routers**.

### Confirm Delete Routers

**Cancel** **Delete Routers**

- 1.6.** Now, navigate to **Networks**. Check the box in the same row as **public**, then click **Delete Networks**.

The screenshot shows the OpenStack interface under the 'demo' project. The left sidebar has 'Network' selected. The main area is titled 'Networks' and displays three items: 'private', 'public', and 'shared'. The 'public' network is selected, indicated by a checked checkbox in its row. A red box highlights the 'Project' column header.

- 1.7.** In the *Confirm Delete Networks* dialog box that pops up, click **Delete Networks**.

### Confirm Delete Networks

**Cancel** **Delete Networks**

- 1.8.** Leave the web browser open and open a terminal window. Source the keystone credentials for the **admin** user.

```
ubuntu@workstation:~$ source ~/keystonerc-admin
```

```
ubuntu@workstation:~$ source ~/keystonerc-admin
ubuntu@workstation:~$ █
```

- 1.9. A few resources need to be created to help with customizing the instances. First, create an external network named **external**. Set the network type to **flat** and the physical network to **public**. Set the network as shared and external.

```
ubuntu@workstation:~$ openstack network create external \
> --external --share \
> --provider-network-type flat \
> --provider-physical-network public
```

```
ubuntu@workstation:~$ openstack network create external \
> --external --share \
> --provider-network-type flat \
> --provider-physical-network public
+-----+-----+
| Field | Value |

+-----+-----+
ubuntu@workstation:~$
```

- 1.13. Connect the router to the **shared-subnet** subnet.

```
ubuntu@workstation:~$ openstack router add subnet \
> exercise-router shared-subnet
```

```
ubuntu@workstation:~$ openstack router add subnet \
> exercise-router shared-subnet
ubuntu@workstation:~$ █
```

- 1.14. Set the **external** network as the gateway for the router.

```
ubuntu@workstation:~$ openstack router set \
> --external-gateway external \
> exercise-router
```

```
ubuntu@workstation:~$ openstack router set \
> --external-gateway external \
> exercise-router
ubuntu@workstation:~$ █
```

- 1.15. Create the key pair **dev-keypair** and save the private key to the file **~/Downloads/dev-keypair.pem**.

```
ubuntu@workstation:~$ openstack keypair create \
> dev-keypair > ~/Downloads/dev-keypair.pem
```

```
ubuntu@workstation:~$ openstack keypair create \
> dev-keypair > ~/Downloads/dev-keypair.pem
ubuntu@workstation:~$ █
```

- 1.16. Use the **chmod** command with a mode of **600** to make it so that the **ubuntu** user has read/write permissions on the file, and groups and other users have no permissions to the file.

```
ubuntu@workstation:~$ chmod 600 ~/Downloads/dev-keypair.pem
```

```
ubuntu@workstation:~$ chmod 600 ~/Downloads/dev-keypair.pem
ubuntu@workstation:~$ █
```

### 1.17. Create the **dev-secgroup** security group.

```
ubuntu@workstation:~$ openstack security group \
> create dev-secgroup
```

```
ubuntu@workstation:~$ openstack security group \
> create dev-secgroup
+-----+
| Field      | Value
+-----+
| created_at | 2023-11-28T22:07:57Z

### Tip

A customization script can be used to perform many commands automatically upon instance creation, such as installing packages, configuring a host name, etc. The simple script above is just an example.

- 1.29.** Once the status for **instance1** is **Active**, attach a floating IP address to it. Select **Associate Floating IP** from the dropdown menu next to **Create Snapshot** in the row for the instance.

Project / Compute / Instances

Instances

Instances											<a href="#">Instance ID</a>	<a href="#">Filter</a>	<a href="#">Launch Instance</a>	<a href="#">Delete Instances</a>	<a href="#">More Actions</a>
	<a href="#">Instance Name</a>	<a href="#">Image Name</a>	<a href="#">IP Address</a>	<a href="#">Flavor</a>	<a href="#">Key Pair</a>	<a href="#">Status</a>	<a href="#">Availability Zone</a>	<a href="#">Task</a>	<a href="#">Power State</a>	<a href="#">Age</a>	<a href="#">Actions</a>				
	<input checked="" type="checkbox"/> <a href="#">instance1</a>	ubuntu	192.168.233.5	m1.small	dev-keypair	Active	nova	None	Running	0 minutes	<a href="#">Create Snapshot</a>	<a href="#">Associate Floating IP</a>	<a href="#">Attach Interface</a>	<a href="#">Detach Interface</a>	<a href="#">Edit Instance</a>
Displaying 1 item															
Displaying 1 item															

- 1.30.** Select any one of the IP addresses from the **IP Address** dropdown and select **instance1: 192.168.233.XYZ** as the **Port to be associated**. Click **Associate**.

## Manage Floating IP Associations

IP Address \*

172.25.250.78

Select the IP address you wish to associate with the selected instance or port.

Port to be associated \*

instance1: 192.168.233.5

Cancel Associate

- 1.31. To verify that the customization script worked, first click on **instance1** under the *Instance Name* column, then navigate to the *Console* tab if you are not directed there automatically. Click on **Click here to show only the console**. Log into the instance as **root** with the password **secret**.

### Note

Be patient for the login prompt. Even if OpenStack reports the instance to be active, it may still take several minutes to fully launch and present the login prompt.

```
Connected to QEMU (Instance-00000009)

root@instance1:~# _
```

- 1.33.** Ensure that the **/root/hello.txt** file exists and has the correct content.

```
root@instance1:~# cat /root/hello.txt
```

```
Connected to QEMU (Instance-0000000b)

root@instance1:~# cat /root/hello.txt
Hello, world!
root@instance1:~# _
```

- 1.34.** Log out of the *Horizon Dashboard* and close the web browser.

- 1.35.** Focus back on the terminal and delete **instance1**.

```
ubuntu@workstation:~$ openstack server delete instance1
```

```
ubuntu@workstation:~$ openstack server delete instance1
ubuntu@workstation:~$ _
```

- 1.36.** Another instance will be created and customized using the *OpenStack Unified CLI*. First, create a **user-data** script that will be attached to the instance at creation. Create a script called **~/hello** that matches the content shown below. Press **CTRL+X**, then **Y** to accept the file changes. Press **Enter** to confirm and exit back to the terminal.

```
ubuntu@workstation:~$ nano ~/hello
```

```
#!/bin/bash
echo 'Hello, world!' > /root/hello.txt
```

```
GNU nano 2.9.3          /home/ubuntu/hello          Modified

#!/bin/bash
echo 'Hello, world!' > /root/hello.txt
[

+-----+
ubuntu@workstation:~$
```

- 1.40. Assign the floating IP generated from the last step to **instance2**.

```
ubuntu@workstation:~$ openstack server add floating ip \
instance2 172.25.250.63
```

```
ubuntu@workstation:~$ openstack server add floating ip \
> instance2 172.25.250.63
ubuntu@workstation:~$
```

Note

The actual value of your floating IP address may be different.

## 2 Verify Customized Instances

In this task, you will verify that cloud-init has correctly customized the two instances created in the previous section.

- 2.1. If a terminal window is not already open, open one and source the admin credentials from the `~/keystonerc-admin` file.
- 2.2. Determine the floating IP address associated with **instance2**. Remember that the floating IP address is in the **172.25.250.0/24** subnet.

```
ubuntu@workstation:~$ openstack server show instance2 \
> | grep address
```

```
ubuntu@workstation:~$ openstack server show instance2 \
> | grep address
| addresses
| shared=192.168.233.92, 172.25.250.63
ubuntu@workstation:~$ █
```

### Note

The floating IP addresses in your output may differ from these examples.

- 2.3. Use the `scp` command to copy the `~/Downloads/dev-keypair.pem` file to the **devstack** machine. When prompted to enter the password for `ubuntu@192.168.1.20`, enter **ubuntu**.

```
ubuntu@workstation:~$ scp ~/Downloads/dev-keypair.pem \
> ubuntu@192.168.1.20:~/dev-keypair.pem
```

```
ubuntu@workstation:~$ scp ~/Downloads/dev-keypair.pem \
> ubuntu@192.168.1.20:~/dev-keypair.pem
ubuntu@192.168.1.20's password:
dev-keypair.pem
100% 1680      2.1MB/s   00:00
ubuntu@workstation:~$ █
```

- 2.4. SSH into the **devstack** machine. The password is the same as the last step.

```
ubuntu@workstation:~$ ssh 192.168.1.20
```

```
ubuntu@workstation:~$ ssh 192.168.1.20
ubuntu@192.168.1.20's password:
Welcome to Ubuntu 22.04.3 LTS (GNU/Linux 5.15.0-1046-kvm x86_64)
